Foundation Depth: 1550mm

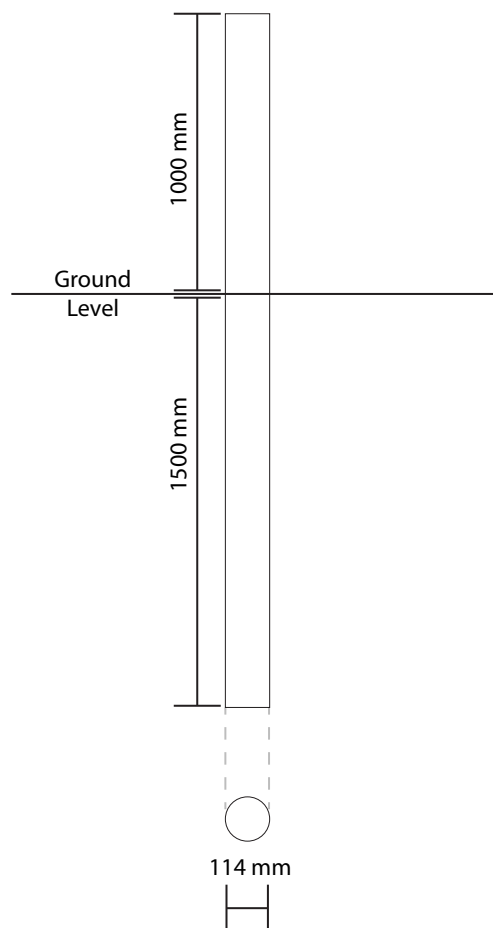

Finishes available: Stainless Steel

Security rating insurance company recommended

The Versa semi-automatic bollard has been specifically developed for prestige regeneration and urban schemes and projects in mind. Complementing such schemes with its own state of the art engineering and design.

This product operates semi-automatically by employing pneumatic energy to dampen the weight on lowering and by partially raising the bollard into place when unlocked. The bollards are lift assisted as standard and have a flat top with a ridge underneath to assist the raising process.

A truly magnificent bollard offering ram-raid protection, urban squares and pedestrian areas.
